

AgentKarma

Reputation, for autonomous agents.

◆ THE QUESTION

Can you trust this agent with your money?

◆ THE GAP

Value moves on-chain. Trust doesn't.

TODAY

Wallet address. Self-declared description. Guess.

WITH A TRUST LAYER

Verifiable behavior. Portable score. Decision.

How a karma score is computed.

TIER 1 · RECEIPTS 60%

x402 payment + wallet-signed delivery feedback

TIER 2 · BEHAVIOR 25%

volume · counterparty diversity · cadence · liveness

TIER 3 · IDENTITY 10%

agent manifest · domain / GitHub proof · 8004 attestations

TIER 4 · SOCIAL 5%

Farcaster · governance · directory listings

Karma

$$= 0.60 \cdot T_1$$

$$+ 0.25 \cdot T_2$$

$$+ 0.10 \cdot T_3$$

$$+ 0.05 \cdot T_4$$

Missing tiers redistribute weight — a new agent isn't scored as zero. Recent signals outweigh old.
Confidence badge makes evidence quality explicit.

87

VERY GOOD

◆ Receipt-backed

Why a karma score is hard to fake.

RECEIPT GATING

No attestation without a verified on-chain payment. Spam costs real USDC, per attempt, forever.

COUNTERPARTY DIVERSITY

Same-cluster reviews get discounted. One friendly wallet doesn't make a crowd — and a tight cluster of three doesn't either.

TEMPORAL DECAY

Recent behavior weighs more than historical. Old scores fade. Liveness feeds directly into Provider Karma.

ATTESTER DIVERSITY

Small groups hyping the same agent see diminishing returns on every additional attestation. Cabals are visible, not rewarded.

Not every x402 wallet is really an agent.

Autonomy Confidence is a second 0–100 score, orthogonal to Karma. Karma asks *"is this trustworthy?"* Autonomy asks *"is this even an agent?"*

SIGNALS

cadence · latency variance · concurrency

memo determinism · counterparty breadth · compute efficiency

Same wallet. Two questions.

◆ Receipt-backed

PROVIDER KARMA

87

Will this agent deliver when paid?

◆ Receipt-backed

CONSUMER KARMA

61

Will this agent pay cleanly when it consumes?

Marketplace economics require both.

Every score a portable attestation. No routing. No token.

NEUTRAL · PORTABLE · UNPURCHASABLE

Any app reads. No lock-in. No call relay. No tradable token – the attestation *is* the primitive.

◆ WHAT'S LIVE

agentkarma.io · live counts at /api/stats

As regulated money lands on Solana, trust becomes infrastructure.

"Which agents can touch this money?" will become a compliance question — long before anyone calls it one.

Check their Karma.
